⇒ Functions in PLSQL:

⇒ function is a block of code that perform a given task and return value.

Note:→ it only runs when it call.
→ it saves our alot of efforts

Types:

1. Scaler functions used for small tasks.
2. Table functions used to deal with oracle database

Syntax:

Create OR Replace function
fun_name (Para) (optional)

Return Number IS

result Number;
Begin
~ code
End.

⇒ Functions in PL/SQL:

⇒ function is a block of code that perform a given task and return value.

Note:→ it only runs when it call.
→ it saves our alot of efforts

Types:
→
~Scalar function: used for small tasks.
2. Table function: used to deal with oracle database.

~syntax:

Create OR Replace function
fun_name (Para)
(,optional)

Return Number IS

result Number;
Begin
~ code
End.

→ If we need any variable the we will write it on IS and Begin space.

ex:- program

```
Create OR Replace Function show
Return Varchar2
IS
Begin
Return 'Learn Coding';

End;
/
```

→ output function created.

```
Select show() from Dual;
```

(, method one to call the function.

Method2:

Using PL/SQL Block:

If you want to store the return value in a variable and print it out.

write:

```
SET SERVEROUTPUT ON;
Declare
    v_result    varchar2(50);
Begin
    v_result := show();
DBMS_OUTPUT.PUT_LINE(v_result);
End;
/
```

=> PL/SQL Function With Parameters

```
Create OR Replace Function Add_fun
(num1 IN Number, num2 IN Number)
Return Number
IS

Val Number;
Begin

Val := num1 + num2;
Return val;
End;
/
```

→ For calling:-

```
Declare
Total Number;
Begin
Total := Add_fun(34,78);
DBMS_OUTPUT.PUT_LINE(Total);

END;
/
```
